

# *South Shore Naturals*

All Natural, Hand Made Skincare

## About South Shore Naturals:

We started making our own chemical-free, all natural skin care products after deciding that we did not want to increase our chances of chronic health issues, particularly cancer, which has increasingly become an epidemic. Simply put, there is just no need for anything extra. Taking care of your skin is just as simple as "less is more" and it doesn't have to be plain or boring!

We try to educate others on the use of Parabens and other chemicals that have been questioned and even linked to health issues. We are getting back to "basics" and rid our lives of unnecessary synthetics and start utilizing more natural personal products, just as our ancestors did before the invention of harsh chemicals.

## About Us

We hope to change the minds of people who over time, have been convinced that only chemical-laden products will work. In the time of our great-grandparents, these things just didn't exist. They used simple, natural ingredients that worked!

In the past half century, we have been bombarded with ads, commercials and advertising that tell us we must use things with a laundry list of chemicals to be effective. There is now a movement to get back to "natural", as it should have always been. People are waking up to the reality that technology has gotten more advanced, yet we as a society have become increasingly sick.

Support your local artisans who use only natural products! Your body will love you for it!

## About John and Jackie Sargent:

We are dedicated to being as sustainable as possible in a world of convenience. We are also striving for a chemical-free, organic lifestyle as much as possible and hope to be fully self-sustainable someday.

We make much of our own products, hunt, fish, garden and grow a lot of our food and medicinal herbs, can and preserve them to save money and avoid chemicals to care for our own well-being.

We try to live off of the land and natural resources as possible and hope that others start also going "back to the basics" to enable conservation of our natural resources for future generations and rely less on manufactured, synthetic products.
